

What predicts ERP conversion success? A review of three literatures

Literature Review · Enterprise Systems · 2026

Sali Halif · CBC Israel — Migration Office

Systematic narrative review

Three literatures address conversion risk but rarely connect

ERP success factors: organisational readiness, top-management support.

Data-quality research: completeness and accuracy drive system trust.

Migration engineering: SUM tooling and simplification items, but atheoretical.

Synthesis shows data quality is named but seldom measured at field level

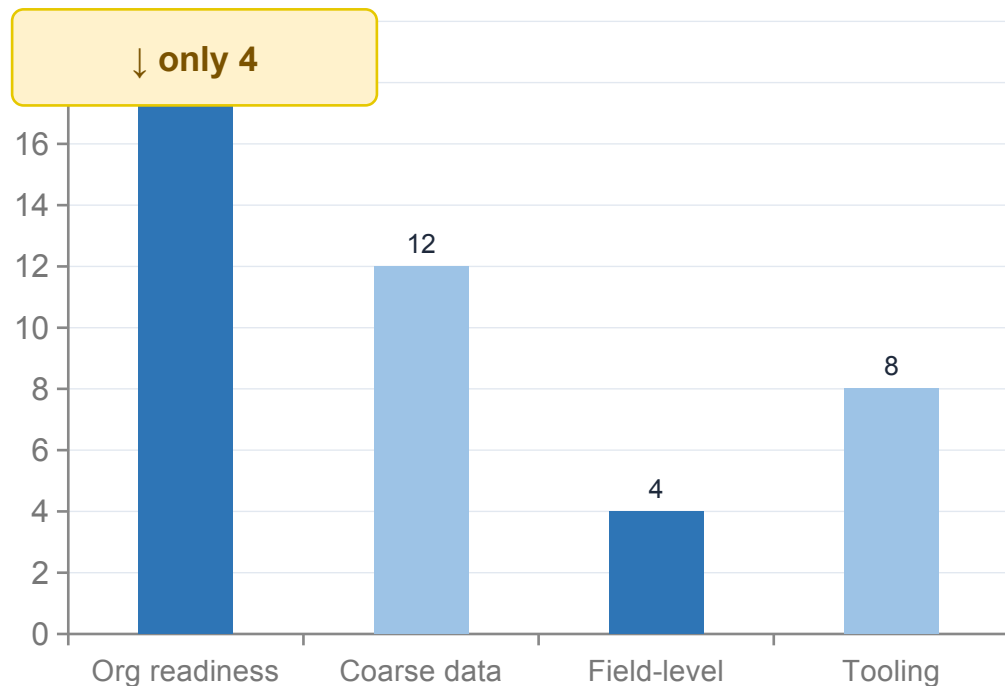

Themes

Theme A: readiness frameworks treat data as one coarse dimension.

Theme B: data-quality work rarely studies ERP cutover specifically.

Theme C: engineering guides omit a predictive readiness metric.

Field-level data-quality measurement is the least-covered theme in the corpus

What to take away

- Org-readiness dominates (18 sources)

Field-level measurement scarce (4)

Tooling covered but atheoretical (8)

The gap motivates new measurement work

The gap is a measurable, predictive readiness metric grounded in theory

Identified gap

What is missing: a field-level completeness metric linked to outcomes.

Why it matters: bridges readiness theory and migration practice.

Next step: empirical test on a live conversion (this programme).

Conclusions

- 1. Literatures are siloed:** readiness, data quality, tooling rarely meet.
- 2. Field-level measure is rare:** only 4 of 42 sources.
- 3. Open problem:** a predictive, theory-grounded completeness metric.
